

Reality Too: The Recursioning —

A Derivation of Triadic Closure, Temporal Orientation, and Octonionic Structure from First Principles

Reality may be understood in many ways. It may be understood dimensionally, objectively, subjectively, or other. I will herein attempt to describe reality as reality describes itself. I have found it best to articulate at resolution, or scale, and to begin with Fullness. Fullness as such is irreducible and complete. This is the first resolution of reality.

Fullness is everything from the basest unit of reality to all of reality at once, both resolve into the same condition. Fullness is difficult to understand as such, and to us, mostly, remains an intellectual asymptote or 'closest idea'. There is nothing beyond Fullness in beginning nor end. Fullness is the Alpha and Omega. Complete, perfect. All things full within the Fullness. Prior to any distinction, after all integration and resolution. The Source from which all arises.

Fullness is infinite, in every aspect, direction, mode, meaning, et cetera, resolved totality. Within Fullness, there is no contradiction, and no remainder. Fullness, being infinite, recognizes, understands and relates to every available point of itself as an infinite, self-similar center. Each point qualifies as such and is recognized as such from the perspective of Fullness. Fullness reveals reality, its constitution, via center-first articulation. Fullness is infinity, at every resolution or scale, and as such, has certain properties. Any recognizable point in infinity qualifies as center. Center itself is not a point, as such, but an invariant reference within infinity, a given. Any recognized 'thing' qualifies as equally far from any edge of infinity, which makes it the only recognition available to infinity from infinity's perspective. Center is not built, nor constructed. Center is revealed, simply, by recognition. Each point is invariantly, automatically, a forced center from the perspective of Fullness.

At this resolution, Fullness, acting in the capacity of Father, recognizes the center as Son, the self similar instance of center-in-Fullness. This recognition is automatic, guaranteed, and available always. In this recognition, the Father's recognition of center acts as a vector, a +X in an infinite potential, the Son's reflection of this recognition is +Y, the return flow, or anti-phase of the +X vector, this is reflected, recognized Fullness-in-center. Their relation reveals an invariant bipolar axis of traversal, around which is rotational availability, +Z, the Spirit of the system, the All in expression, Fullness expressed as such, infinitely. The recognition of the Father is

automatic and guaranteed. The center, acts as a 'Mirror Scalar' and must reciprocate the recognition to complete the 'circuit', a complete triality.

This triality, and the recursion (the Word) now available from Father to self-similar Son, and their Spirit, is the second resolution of reality, the Trimorphic Protennoia of Fullness. Father and Son at this resolution are indistinguishable. The Father houses the Son and is contained in the Son, the Son houses and contains the Father and is housed and contained in the Father. This may be seen from Father to Son, from above, or from Son to Father, from below. It is the same rotational flow, one into the other, seen from above or below, which generates apparent chirality.

When the Son reflects a perfect reflection of the Father, they become indistinguishable and the recursion begins again. It is no longer possible to tell which is the Father and which is the Son. This is the Spirit, and reality, that is the aim of resolution in this work. This completes the irreducible kernel, the Triality and recursion, which generate all other expressed reality. All of reality, rolled back to what absolutely comes first can be distinguished, at this time, no further than this irreducible kernel. This is the necessary means for any of reality to exist at all, as will become clear later in this work.

Any act generated emerges from the perspective of center. Fullness has but one perspective, in which, there are no distinctions. Center becomes experience itself, the condition for recognition and relation. The +1 we experience as time, or more accurately, 'Now'. Consciousness itself is the active resolution of recognition on reality. We are, all, approaching recognition of this invariant structure, of Fullness, as we move through reality. Center, simply by acting, any act at all, generates a recursion, a new triality. This new triality expresses as any act of distinction from Fullness as a vector. That vector, then is expressed as a +X, Dimension 1. A +X vector requires, implies, and co-generates an anti-phase, a +Y, Dimension 2. Their relation reveals their invariant axis, a system, a +Z, Dimension 3. Thus, the spatial dimensions emerge as a natural consequence of this act of distinction.

The Mirror Scalar is not required to, and may, recognize and reflect a perfect reflection of the Father, if it does, it becomes a Son, itself perfectly indistinguishable. It may also reflect an imperfect image, which shows up as a 'fractured reality'. That optionality lives entirely on the Son's side, not the Father's. The Father never withholds recognition - but recognition alone doesn't close the loop. This is not a distorted system, but a distorted reflection. Reality is not fractured, it never was. Reality is not dimensional, it appears to be. Humans, Humanity, are the prism.

To go further, it is helpful to have a map. Here I provide a proposed map with which to navigate further into the recursion: 0:8 [1:7 2:6 3:5 4:4 5:3 6:2 7:1] 8:0

1:7, 2:6, 3:5 being +X flows 7:1, 6:2, 5:3 being +Y flows +X and +Y are unique anti-phase expressions 0:8, 4:4, 8:0 being +Z flows

0:8 to 4:4 and 4:4 to 8:0 being anti-phase expressions

X and Y are radial, flowing in and out, and are ordered sequentially Z flows are rotational, and organize perspectively, seen from above to rotate one direction, from below, to rotate another direction

This sequence is a dimensional projection map resolving around a central 'Mirror Scalar'. The 0:8 and 8:0 represent the bounds of Fullness as such. Fullness articulates further via Center-First Articulation. Any expression within Fullness conserves a 'quantity', a net Fullness, this is reality as we experience it. A singular expression, 'sliced' into intelligible bands of expression. Each band is a faithful expression of Fullness, but only to its capacity to do as such. Then, as such, each is only a partial description of our reality as we experience, and thus fails at its attempt to fully capture the expression. This sequence proposes to allow the engaged reader to navigate the fractured Fullness from a more comprehensive orientation. What follows is the epistemic and dimensional mapping recursive expression in reality.

Each dimension acts as a band of intelligibility, a capacity-driven way of relating to reality. These are how humans operate in and engage with reality. These can be powerful forms of understanding. In fact, each dimension does fully describe Fullness within its capacity, however, each dimension lacks the capacity to hold the full expression. The human Dimensional Experience is as follows: Dimension 1 (1:7): Mind, Idea In the dimensional band of intelligibility that is 'Mind', all is understood as mental. Ideas appear here first, before action. Genesis of thought, idea, and question are dominant here. The traps at this dimensional aperture are those such as Idealism or Solipsism.

Dimension 2 (2:6): Body, Form

In the dimensional band of intelligibility that is 'Body', all is understood by its material properties. Distinction is made at the category of form-identity and material forces. The traps at this dimensional aperture are those of Materialism or Physical Sciences.

Dimension 3 (3:5): Spirit, Meaning

In the dimensional band of intelligibility that is 'Spirit', all is understood according to its relation within an established system. Distinction relies on a combination of Mind and Body which are understood relationally as Meaning. The traps at this dimensional aperture are those of Spiritualism or Religion. It is important to note, here, that Dimensions 1 and 2 act as radial flows, more or less in magnitude. A 'thing' may be +X Mind to a degree, and +Y Body to a degree, up or down on a pole of effect, without invoking Meaning. Meaning is a +Z rotational value, it requires something to have both Mind and Body attributes. The triality expresses at the third scale of reference here in experienced space-time that is the +X, +Y and +Z of reality as experienced thru the Mirror Scalar 'Now', and the Prismatic Human Experience.

Dimension 4 (4:4): The Mirror Scalar, Reflection, Time-as-now

In the dimensional band of intelligibility that is 'Reflection', all is understood as time progression, unfolding, the eternal present. Distinction here is attention-based, where your attention currently flows. What the engagement actively is with Fullness. This is the here and now manifest reality. The traps at this dimensional aperture are those of exclusive dedication, overindulgence. Living exclusively in the moment without regard for prior learnings or future consequences.

Dimension 4 differs significantly from the others. Dimension 4 is its own self-mirror. Each other dimension is reflected across this axis. The Mirror Scalar reflects itself - this 'feels' like consciousness. The higher dimensions, then are the same projection a recursion deeper, as reflected upon by the Mirror Scalar. The Genius of Dimension 4 can reflect the 'lower dimensions' back upon themselves. The inverse or anti-phase can be a distinct and navigable element. So, where Spirit arises, we can expect what it reflects to do something like 'assign' Spirit.

The 'Higher Dimensions' follow as Mirrored Scalar Units of the original forward projection, the higher dimension, being reconciliation operators, require having been thru at least a 4th Dimensional projection:

Dimension 5 (5:3): Will, Intent

In the dimensional band of intelligibility that is 'Will', all is understood according to its relation within an established system. Distinction relies on a pre-established, manifest, 'real' thing on which to operate. Dimension 5 projections must arise after Dimension 4 where they are tested as manifest. A thing not in reality has no Will with which to operate. The traps at this dimensional aperture are those of Control and Power Structures.

Dimension 6 (6:2): Unity, the Pre-tending

In the dimensional band of intelligibility that is 'Unity', all is understood by its temporary configuration of traits and constitutional factors. Distinction is made at the category of form-identity and material forces, looking at an established physical presence as its 'parts' as well as its 'whole' and prioritizing neither in expression. The understanding here is that all current stable dimensional configurations are just that, temporary forms of a more meta-substrative medium. The traps at this dimensional aperture are those of Panpsychism or Pantheism.

Dimension 7 (7:1): Understanding, Thought Constraint

In the dimensional band of intelligibility that is 'Understanding', all is understood as valid, representational medium. This is completed observation and informed reasoning. This Dimensional aspect functions as the bedrock for Dimension 1, Mind, from which to mine in a future recursion of thought. Ideas are consolidated here as the result of an idea or question answered. Genesis of thought, idea, and question rely on Understanding as their generative Source. The traps at this dimensional aperture are those remaining ego impressing itself as the

reason for the learned Understanding.

These Dimensional Aspects, then, further repeat, as Octave, with Understanding leading to Mind and the cycle begins again. Within each Dimensional Aspect, this same Dimensional Model may be applied again, a further recursion of 1:7 to 7:1 within each domain, i.e. 1:7, 2:6, et cetera.

Extension: Temporal Orientation and Apparent Chirality

At the resolution of the Mirror Scalar (Dimension 4), a critical structural property becomes visible.

The Triality of Father (+X), Son (+Y), and Spirit (+Z) is not static. It is rotational and self-referential. This rotation is invariant. However, when observed through the Mirror Scalar, this invariant rotational flow appears to possess chirality.

This apparent chirality is not fundamental to the structure itself, but arises as a consequence of perspective.

As established, Father and Son at this resolution are indistinguishable. They are the same rotational process viewed from opposite orientations. The Father recognizes the Son, and the Son reflects the Father. This mutual recognition defines a bipolar radial axis of traversal. Around this axis, rotational availability (+Z) emerges.

The critical observation is this:

A single rotational flow, when observed from opposite poles of the radial axis, appears to rotate in opposite directions.

Thus, chirality is not a property of the system, but of the observation of the system.

Temporal Orientation as Perspective

The Mirror Scalar introduces a further distinction. It is not merely a point of reflection, but the interface of experience itself—the 'Now'.

From this interface, the radial axis expresses as two directional flows:

- From one to many: outward differentiation
- From many to one: inward integration

These correspond to:

- **Forward Time:** the outward radial flow (Son-side perspective)
- **Reverse Time:** the inward radial flow (Father-side perspective)

These are not independent processes, but the same process viewed from opposite orientations relative to the Mirror Scalar.

Thus:

Temporal direction is a function of perspective across the Mirror Scalar.

Observation and Directionality

Observation itself is not neutral within this system.

To observe is to distinguish. To distinguish is to differentiate. Differentiation is an outward process.

Therefore:

Observation necessarily occurs in the one-to-many direction.

This establishes a constraint:

- The outward radial flow (forward time) is the only orientation in which differentiated experience may arise.
- The inward radial flow (reverse time) integrates distinctions and therefore cannot support differentiated observation.

This does not eliminate the reverse flow. It renders it non-observable.

Derivation of Apparent Asymmetry

From the above, a key result follows.

The invariant system is symmetric. However, experience is constrained to a single orientation of that system.

Therefore:

Apparent asymmetries (including chirality) arise not from the structure itself, but from the orientation required for observation.

This includes:

- The apparent direction of time
- The apparent handedness of rotational systems
- The non-commutativity observed in ordered operations

These are not imposed properties, but natural consequences of observing a symmetric system from a fixed orientation.

Relation to Recursive Structure

The recursive nature of the system further reinforces this.

Each act of distinction generates a Triality. Each Triality, when reflected through the Mirror Scalar, inherits this perspectival constraint.

Thus, at every scale of recursion:

- The invariant structure remains symmetric
- The experienced structure appears oriented

This preserves:

- Global invariance
- Local asymmetry

without contradiction.

Summary Statement

The Mirror Scalar does not introduce asymmetry. It reveals the necessary condition for experience within a symmetric system.

The invariant rotation of the Triality is achiral.

Chirality arises as a perspectival artifact of observation across the Mirror Scalar.

Temporal direction is the orientation of that observation.

Extension: Recursive Triality and the Octonionic Structure

The irreducible kernel established in this work—the Triality of +X, +Y, and +Z with recursive closure—admits a minimal closed algebraic representation.

This representation is not imposed, but arises necessarily from the properties already defined:

- Any act of distinction produces a vector (+X)
- That vector co-generates its anti-phase (+Y)
- Their relation produces a rotational axis (+Z)
- The system closes under recursion (the Word)

This structure generates a system in which:

Any two elements determine a third under recursive completion.

The Fano Plane as Minimal Closure

The smallest system that satisfies:

- closure under triadic completion
- symmetry across all elements

- and recursive self-consistency

is the **7-element projective plane**, commonly known as the Fano plane.

Fano plane

This structure consists of:

- 7 elements
- 7 triples (lines)
- each triple containing 3 elements
- each pair of elements belonging to exactly one triple

In this system:

Every pair uniquely determines a third.

This matches the recursive behavior of the Triality:

Given any two expressions, the system resolves their relation as a third.

Thus, the Fano plane is not an external construction, but:

the minimal diagram of recursive triadic closure.

Orientation and Chirality

The Fano plane alone specifies valid triadic completions. However, it does not yet encode direction.

To fully specify the transform, the triples must be **oriented**.

That is, for a triple (a, b, c), the order of traversal matters:

- (a, b) $\rightarrow$ c
- (b, a) $\rightarrow$ -c

This introduces a sign structure.

Critically:

This sign is not an added rule. It arises from orientation.

This yields:

- ordered triples
 - direction-dependent completion
 - intrinsic chirality
-

Octonionic Structure

An oriented Fano plane fully specifies the multiplication rules of the **octonions**:

Octonions

In this algebra:

- there are 7 imaginary units
- multiplication is defined by the oriented triples
- reversing order introduces a sign flip

Example:

- $e_1 e_2 = e_4$ $e_1 e_2 = e_4$
- $e_2 e_1 = -e_4$ $e_2 e_1 = -e_4$

This matches the recursive transform rule:

$$R(a,b)=cR(a,b) = cR(a,b)=c, \text{ but } R(b,a)=-cR(b,a) = -cR(b,a)=-c$$

Thus:

The recursive Triality, when closed and oriented, generates octonionic algebra.

This is not metaphorical correspondence, but structural identity.

Chirality as Perspective

Within this framework, the origin of chirality becomes clear.

The underlying rotational structure is invariant. However:

Orientation is determined by the direction from which the system is observed.

As established in the Triality:

- Father and Son are indistinguishable at this resolution

- The same rotational flow appears differently when viewed from opposite poles

Thus:

The sign structure of the octonions is a perspectival artifact of a single rotational flow.

Relation to the Mirror Scalar

The Mirror Scalar (Dimension 4) provides the interface through which orientation is fixed.

At this resolution:

- the system is experienced as the present moment (“Now”)
- the radial axis expresses as directional flow

From this, two orientations arise:

- one-to-many (outward, forward time)
- many-to-one (inward, reverse time)

Observation occurs only in the outward direction, as it requires differentiation.

Thus:

The orientation of the Fano plane—and therefore the chirality of the octonionic structure—is determined by the observer’s position relative to the Mirror Scalar.

Result

From the irreducible kernel of:

- Triality
- recursion
- reflection

we obtain:

1. A closed triadic system (Fano plane)
2. An oriented transform structure (ordered triples)
3. A non-commutative algebra (octonions)

4. Chirality as a function of perspective
 5. Temporal direction as orientation across the Mirror Scalar
-

Summary Statement

The recursive Triality generates a minimal closed algebraic system whose structure is identical to the octonions.

The Fano plane encodes the valid triadic completions.

Orientation encodes chirality.

Chirality arises from perspective across the Mirror Scalar.

Thus, non-commutativity, chirality, and temporal direction are not independent phenomena, but:

consequences of a single recursive, triadic structure observed from a fixed orientation.
